## Introduction

- Studies on how students' learning of introductory physics concepts is supported by physical and virtual manipulatives have found mixed results
  - Learning may be enhanced by virtual experimentation (Zacharia, Olympiou & Papaevripidou, 2008; Finkelstein *et al.*, 2005)
  - Learning may be similar for both manipulative types (Klahr, Triona & Willaims, 2007; Zacharia & Constantinou, 2008)
  
- Our previous research in the context of **simple machines** shows the difference may be concept-based (Gire *et al.*, 2010)
  - Physical manipulatives better for force
  - Virtual manipulatives better for work and energy

## Purpose of Study

- Zacharia and Anderson (2003) have shown **simulations** improve students' predictions and explanations of physical experiments
  - Performing a virtual experiment may improve learning in a physical experiment
  
- Research Question: *Does a prior experience with a virtual experiment change the type of interpretations students make of the data from a physical experiment?*

## Theoretical Underpinnings

- Possible stances towards anomalous data (Chinn & Brewer, 1983)
  - Ignore the data
  - Reject the data
  - Hold the data in abeyance
  - Reinterpret the data while maintaining the existing theory
  - Make peripheral theory changes
  - Change the theory

## Theoretical Underpinnings

- Stance may be influenced by properties of data
  - Less credible data is easily *rejected*
    - Previous work (Chini *et al.*, 2010) shows students trust the simulation over the physical experiment
  - Ambiguous data is easily *reinterpreted*
    - Physical experiment generates “messy” data due to frictional effects and measurement errors

## Theoretical Underpinnings

- Dynamic Transfer  
(Schwartz, Varma & Martin, 2008)
  - Learning environment plays a role in *dynamic transfer*
    - Allows for distributed memory
    - Affords alternative interpretations
    - Offers candidate structures by constraining & structuring actions
    - Provides a focal point for coordination
  - Physical and virtual manipulatives may offer *different support* for dynamic transfer

# Curriculum

- **CoMPASS** (Concept Mapped Project-based Activity Scaffolding System) (Puntambekar, Stylianou & Hübsher, 2004)
  - Inclined Plane unit
- Explores how length, height, surface of inclined plane affect **force** and **work** needed and **mechanical advantage** of inclined plane

**Inclined Plane Family**

The inclined plane family includes three **simple machines**: the **inclined plane**, **wedge** and **screw**. They are in the same family because they have sloping surfaces that can be used to reduce the force needed to do work.

- An **inclined plane**, or ramp, is a slanted surface for lifting or lowering objects.
- A **wedge** is a movable sloping surface used for slicing, cutting, stopping, or lifting objects.
- A **screw** is a sloping surface wrapped around a central bar or axis. Screws are used for lifting and fastening things.

Simple machines in the inclined plane family can increase mechanical advantage. Mechanical advantage is increased by using a longer and less steep sloping surface. When a machine has more mechanical advantage, less force is needed to do work.

Why?

When the sloping surface is less steep, more of the weight of the object is able to rest on the surface of the machine. This means that you will need to apply less force than when lifting the object straight up on your own.

# Manipulatives

**Inclined Plane Simulation**

Block Height = 8 in

Experiment Set Up			Controls		Measurements			
Ramp Length	Ramp Height	Load	Effort Force	Work (Input)	Potential Energy	Ideal MA	Actual MA	Efficiency
3.0 m	0.20 m	3.0 N	2.0 N	6.0 J	6.0 J	3.0	0	

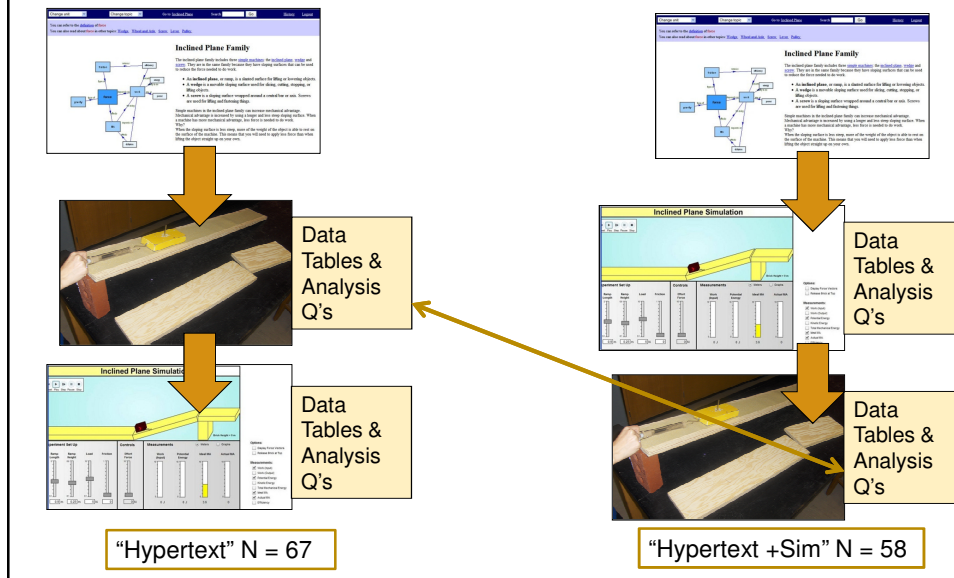

**Options:**

- Display Force Vectors
- Release Block at Top

**Measurements:**

- Work (Input)
- Work (Output)
- Potential Energy
- Kinetic Energy
- Total Mechanical Energy
- Ideal MA
- Actual MA
- Efficiency

# Study Design

# Participants

- Enrolled in conceptual-based physics laboratory
  - Four sections
  - Taught by undergraduate teaching assistants
- Experiments completed as part of laboratory
  - Two sections in Hypertext group
  - Two section Hypertext+Sim group

## Analysis

- Categorized students' responses to open-ended analysis questions
- Used chi-square test for independence to determine if there was a difference in the types of responses provided by Hypertext and Hypertext+Sim groups
  - For significant result, examined adjusted residuals to determine which cells contributed to the significant difference (Haberman, 1973)

## Analysis Questions

- Students responded to 18 analysis questions
    - Force needed to lift load\*
    - Work needed to lift load\*
    - Change in load's potential energy\*
    - Comparison of work and potential energy<sup>§</sup>
    - Ideal mechanical energy\*
    - Actual mechanical energy\*
- \* How does changing each parameter (length, height or surface) affect the quantity?
- <sup>§</sup> How does changing the friction of the surface affect the relationship?

## Results By Question

Q#	Physical Quantity	Parameter	$\chi^2$	p-value	Effect Size
<b>Q1L</b>	<b>Force</b>	<b>Length</b>	<b><math>\chi^2(2, N=108) = 13.2</math></b>	<b>.001</b>	<b>.35</b>
Q1H*	Force	Height	$\chi^2(2, N=109) = 4.1$	.162	.20
Q1S	Force	Surface	$\chi^2(1, N=108) = 7$	.404	.08
<b>Q2L</b>	<b>Work</b>	<b>Length</b>	<b><math>\chi^2(2, N=108) = 20.1</math></b>	<b>&lt;.001</b>	<b>.43</b>
Q2H*	Work	Height	$\chi^2(2, N=108) = 7$	.753	.08
Q2S	Work	Surface	$\chi^2(1, N=108) = 1.5$	.221	.12
Q3L*	Potential Energy	Length	$\chi^2(1, N=107) = 1.3$	.437	.11
Q3H*	Potential Energy	Height	$\chi^2(1, N=107) = 1.1$	.363	.10
Q3S*	Potential Energy	Surface	$\chi^2(1, N=106) = 1.3$	.438	.11
<b>Q4A*</b>	<b>Work/Potential Energy</b>	<b>Rough</b>	<b><math>\chi^2(3, N=108) = 21.2</math></b>	<b>&lt;.001</b>	<b>.44</b>
<b>Q4B</b>	<b>Work/Potential Energy</b>	<b>Smoother</b>	<b><math>\chi^2(3, N=108) = 29.4</math></b>	<b>&lt;.001</b>	<b>.52</b>
<b>Q4C</b>	<b>Work/Potential Energy</b>	<b>No friction</b>	<b><math>\chi^2(2, N=107) = 31.4</math></b>	<b>&lt;.001</b>	<b>.54</b>
<b>Q5L</b>	<b>Ideal MA</b>	<b>Length</b>	<b><math>\chi^2(1, N=107) = 7.0</math></b>	<b>.008</b>	<b>.26</b>
Q5H	Ideal MA	Height	$\chi^2(1, N=107) = 6$	.426	.08
Q5S	Ideal MA	Surface	$\chi^2(1, N=103) = 3.1$	.079	.17
<b>Q6L</b>	<b>Actual MA</b>	<b>Length</b>	<b><math>\chi^2(2, N=108) = 10.7</math></b>	<b>.005</b>	<b>.31</b>
Q6H*	Actual MA	Height	$\chi^2(2, N=108) = 2.9$	.280	.17
Q6S*	Actual MA	Surface	$\chi^2(2, N=108) = 6.0$	.063	.24

Note: Asterisk indicates exact test was used. Bold indicates significant at the  $p < .005$  level.

## Hypertext + Sim Supports Dynamic Transfer

Question: Comparison of work & potential energy for different surfaces

- *Friction present*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
Work is greater than PE		x
Work is equal to PE		x
Work increases & PE stays the same	x	
Other		

## Hypertext + Sim Supports Dynamic Transfer

Question: Comparison of work & potential energy for different surfaces

- *Surface gets smoother*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
Work & PE get closer		x
Work is equal to PE		x
Work decreases & PE stays the same	x	
Other		

## Hypertext + Sim Supports Dynamic Transfer

Question: Comparison of work & potential energy for different surfaces

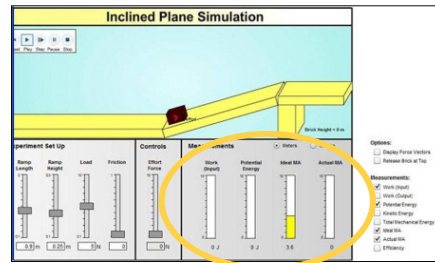

- *Frictionless*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
Work is equal to PE		x
Work decreases & PE stays the same	x	
Other		

## Hypertext + Sim Supports Dynamic Transfer

- Result:
  - Hypertext+Sim students more likely to describe *relationship* of work and potential energy
  - Hypertext students more likely to discuss work and potential energy *separately*

- Possible Explanation
  - Simulation bar chart display provides “focal point for coordination”

## Different Responses to Anomalous Data

Question: How does increasing *length* of IP affect *work*

- Would like students to focus on similarity of work values for different lengths in physical experiment

Response	Group more likely?	
	Hypertext	Hypertext+Sim
Work would increase		X
Work would stay the same	X	
Work would decrease		X

- Similar finding when students were asked to compare work and potential energy for a frictionless surface

## Different Responses to Anomalous Data

- Result
  - Hypertext+Sim students more likely to focus on *similarity* of work values or work & potential energy values
  
- Possible Explanation
  - Chinn & Brewer's framework of possible responses to anomalous data
    - Hypertext+Sim sequence students encounter easy to interpret data *before* ambiguous data. May reinterpret physical data to fit theory developed from simulation.

## Hypertext Performs Better on Length Questions

Question: How does increasing *length* of IP affect *force*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
Force would decrease	x	
Force would stay the same		
Force would increase		x

## Hypertext Performs Better on Length Questions

Question: How does increasing *length* of IP affect *ideal mechanical advantage*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
IMA would increase	x	
Other		

## Hypertext Performs Better on Length Questions

Question: How does increasing *length* of IP affect *actual mechanical advantage*

Response	Group more likely?	
	Hypertext	Hypertext+Sim
AMA would decrease		x
AMA would stay the same		
AMA would increase	x	

## Hypertext Performs Better on Length Q's

- Finding
  - Students in Hypertext group were more likely to provide a correct description of the relationship between length and
    - Force
    - Ideal mechanical advantage
    - Actual mechanical advantage
- Possible Explanation
  - Students may be more aware of length in physical experiment
  - Force and mechanical advantage can be “felt” in physical experiment

## Conclusions

- Prior virtual experience influenced descriptions of data from physical experiment
  - More useful comparisons between work and potential energy
  - Supports finding of Zacharia & Anderson, 2003
- Students with prior virtual experience had more *incorrect* descriptions relating to **length** and **force** or **MA**
- Prior virtual experience may help students to interpret the data from a physical experiment in a more scientific manner

## Future Work

- Explore alternate interpretations of data
  - E.g. Hypertext+Sim had more time on task
  
- Explore students' explanations of the relationships involving work and potential energy
  - Do explanations of Hypertext+Sim group show evidence of considering the role of friction in the physical experiment?
